802.11 TIMELINE – OVER 20 YEARS!

Wi-Fi 4 VS 5 VS 6

Feature	Wi-Fi 4	Wi-Fi 5	Wi-Fi 6
Channel Bandwidth	20, 40 MHz	20, 40, 80, 80+80, 160 MHz	20, 40, 80, 80+80, 160 MHz
Frequency Bands	2.4 & 5GHz	5 GHz	2.4 & 5 GHz
Maximum Data Rate	450 Mbps*	2.34 Gbps*	9.6 Gbps*
Highest Order Modulation	64-QAM	256-QAM	1024-QAM
Spatial Streams	4	4	8
Associated 802.11 spec	802.11n	802.11ac	802.11ax

* Depends on number of spatial stream and channel bandwidth used.

Wi-Fi 6 Key Features

Wi-Fi 6 TOP FEATURES

OFDMA

MU-MIMO

Higher Rates

2.4 / 5GHz

Target Wake Time

BSS Coloring

Wi-Fi 6 & IOT

- The growth of IoT devices integrated into the home continues to accelerate
 - Gaming, Voice Assistance, Smart Home, Work-From-Home
- These devices need reliable, secure and long-lasting connections
- Wi-Fi 6 provides the path to a better user experience:
 - OFDMA: Improving network efficiency by 60% over Wi-Fi 5, OFDMA enables simultaneously updates to/from IoT devices, and can effectively manage multiple Wi-Fi voice calls while supporting music streaming and lower bandwidth applications like internet browsing.
 - MU-MIMO: Doubling the throughput for high bandwidth applications, MU-MIMO can lower wait time during heavy uses cases (e.g. work from home) and improve gaming experience with higher bandwidth and lower latency
 - Higher data rates: Transfers data >30% faster than Wi-Fi 5 leaving more airtime for other devices and applications
 - TWT: Allows a client to negotiate a sleep schedule resulting in longer battery life and less contention
 - 2.4GHz support: Apply all the advantages of Wi-Fi 6 to 2.4GHz band.
 - BSS Coloring: Enables clients to more efficiently use their available bandwidth when neighboring traffic is present (e.g. non-managed MDUs)
- Providing a more efficient, higher capacity network, Wi-Fi 6 enabled products will soon become your new favorite devices

Wi-Fi 6 EXPANDED FEATURE SUMMARY

Feature	Advantage	WFA AP	WFA μAP	WFA STA
DL OFDMA	↑ efficiency, ↓ latency	M (Tx)	O (Tx)	M (Rx)
UL OFDMA	↑ efficiency, ↓ latency	M (Rx)	O (Rx)	M (Tx)
DL MU-MIMO	↑ capacity & per user data rate	M (Tx)	O (Tx)	M (Rx)
UL MU-MIMO	↑ capacity, ↓ latency	O (Rx)	O (Rx)	O (Tx)
1024 QAM	↑ per user data rate by > 38% over Wi-Fi 5	O	O	O
2x/4x HE-LTF	↑ throughput & robustness	M	M	M
1x HE-LTF	↑ throughput & robustness	O	O	O
Beamforming	↑ rate at range	M	O	M (BFee)
Target Wake Time (TWT)	longer battery life for clients	M	O	O
OBSS-PD (aka BSS Coloring)	↑ spectral efficiency	M	M	M
Operational Mode Indication (OMI)	Allow clients to opt out of MU	M	M	M
Dual Carrier Modulation (DCM)	↑ range & robustness	O	O	O
Extended Range (RE)	↑ range @ lower rates	O	O	O
8x8 Sounding Feedback	↑ range & DL MU-MIMO robustness	O	O	O

OFDMA

SECURE CONNECTIONS
FOR A SMARTER WORLD

ORTHOGONAL FREQUENCY-DIVISION MULTIPLE ACCESS

- OFDMA is the ability to simultaneously pass traffic between an AP and multiple STAs using frequency diversity
 - A channel is split into resource units (RUs) and a STA is allocated an RU(s) depending on its throughput requirements relative to other STAs in a given OFDMA group
 - Support of up to 16 users provides the best combination of performance and scheduling complexity
- OFDMA Advantages
 - By combining the protocol overhead of multiple packets into a single packet, OFDMA:
 - Increases the efficiency of a network
 - Lowers per client latency
- OFDMA is ideally suited for smaller packets which is the majority of Wi-Fi traffic
 - Lowers contention in a home with multiple IoT devices, streaming music, Wi-Fi calls and internet browsing all happening simultaneously

88W9064 DL UDP OFDMA

Average Efficiency Gains > 60%

88W9064 UL UDP OFDMA

Up to 4x increase in throughput

Multi-User MIMO

MULTIPLE USER (MU) MIMO

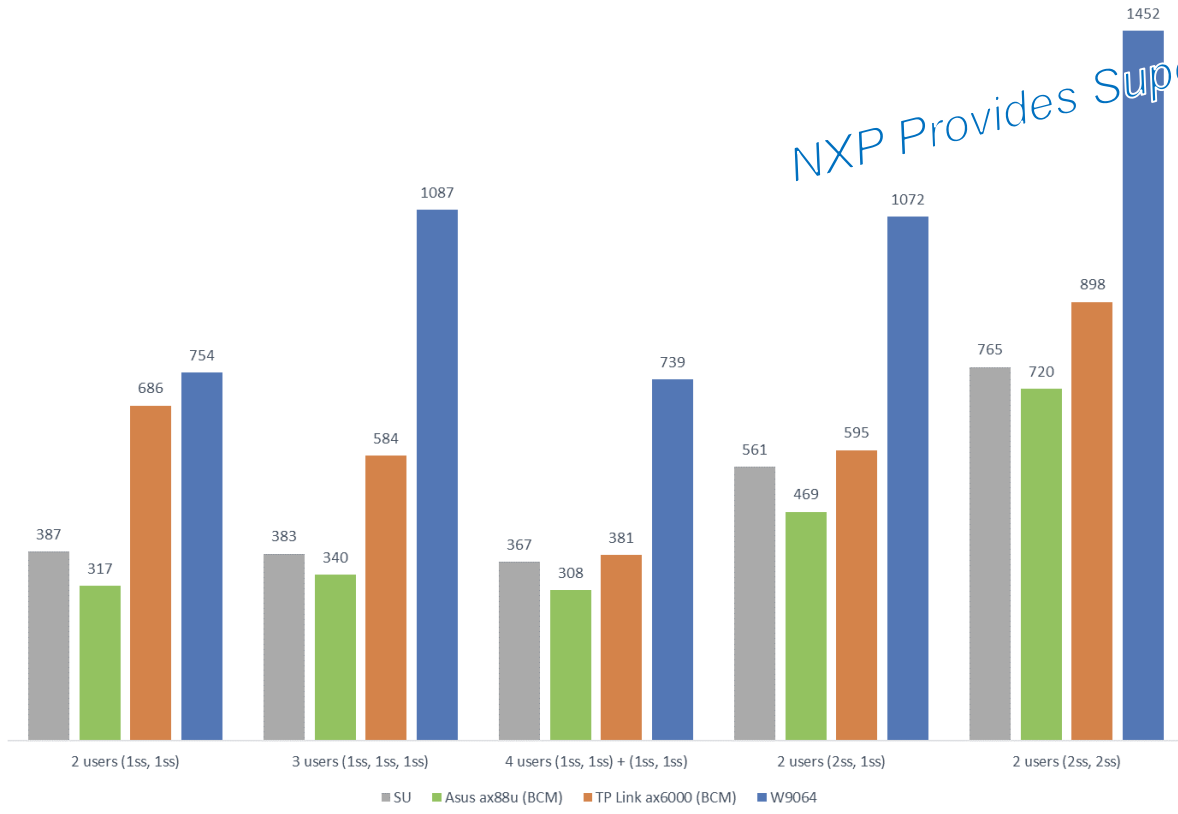

- MU-MIMO is the ability to simultaneously pass traffic between an AP and multiple STAs using spatial diversity
 - Downlink(DL) is AP to STA
 - Uplink (UL) is STA to AP
 - A 4x4:4SS AP can support up to four 1x1 STAs
- DL MU-MIMO Advantage
 - Increases per STA throughput and lowers contention in the network resulting in a capacity increase
- UL MU-MIMO Advantage
 - Lowers per STA latency while also increasing the channel capacity
- MU-MIMO is ideally suited for large bandwidth applications running concurrently
 - Better U-HD video streaming (e.g. Netflix) experience for home users; especially in contentious environments
 - Less wait time during heavy uses cases (e.g. work from home) while pulling/pushing cloud data
 - Lower latency and higher bandwidth for Cloud applications (e.g gaming, car-to-cloud)

DOWNLINK (AP -> STA) MU-MIMO

Wi-Fi 5 UDP 5G

NXP Provides Superior Performance!

Wi-Fi 5 TCP 5G

- Shield Room OTA
- 1x1: Acer laptop
- 2x2: Intel AX200

Wi-Fi 6 DL MU-MIMO OTA UDP PERFORMANCE

Commercially available Wi-Fi 6 APs do not support MU-MIMO currently

Higher Rates

1024-QAM

- 802.11ax introduced 1024 Quadrature Amplitude Modulation (QAM)
 - 802.11ac supports up to 256-QAM
 - 1024-QAM encodes more data in the same amount of spectrum
- Up to 38% increase in data rate at close range with Wi-Fi 6
- Wi-Fi 6 data transfers can occupy less air-time lowering channel contention and leaving capacity available for older clients

Wi-Fi 6 VS Wi-Fi 5 OVER-THE-AIR THROUGHPUT

- UDP
- WPA2+AES
- AMPDU + AMSDU 11K

Target Wake Time

TARGET WAKE TIME (TWT)

- A Wi-Fi 6 AP can negotiate the TWT function with participating STAs to define a specific time or set of times for individual stations to access the medium.
 - The TWT STAs and the AP exchange information that includes an expected activity duration.
- Two TWT modes
 - Individual: STA and AP negotiate start time of sleep period and wake interval.
 - Broadcast: Allows an AP to set up a shared TWT session for a group of STAs and periodically specify the TWT parameters set within Beacon frames.
- TWT Advantages:
 - Can significantly improve battery life versus current power save modes
 - Reduces contention as IoT clients wake up less often
 - Allows AP to schedule uplink traffic

OBSS-PD (aka BSS coloring)

Wi-Fi 6 EXTENDED RANGE

- 802.11ax defines an extended range packet format to increase coverage; especially in outdoor deployments
- In addition, Dual Carrier Modulation (DCM) has been introduced
 - DCM replicates the same information on different subcarriers to improve robustness of the Wi-Fi 6 link
- The defined data rates are all below 6Mbps
 - 3.6 Mbps (ER for 20MHz MCS0 + Dual Carrier Modulation)
 - 3.2 Mbps (ER + RU106 in 20MHz MCS0)
 - 1.6 Mbps (ER + RU106 in 20MHz MCS0 + DCM)
- Extended range capabilities can increase the range of a Wi-Fi link by more than 50%

8x8 Sounding Feedback

SECURE CONNECTIONS
FOR A SMARTER WORLD

8X8 SOUNDING FEEDBACK

- To support TX Beamforming and DL MU-MIMO, the STA has to measure and communicate channel information through a channel **Sounding** process.
- Wi-Fi 6 added support for 8x8 APs; however, it is **optional** for STAs to provide sounding feedback to APs larger than 4x4 so 8x8 performance will not be realized by all STAs.
- NXP solutions support 8x8 sounding to take full advantage of 8x8 AP->STA performance benefits:
 - Increases rate over range by > 5dB
 - Increase DL MU-MIMO throughput >50%

8X8 SOUNDING FEEDBACK – INCREASED RANGE

8X8 SOUNDING FEEDBACK – INCREASED DL MU-MIMO THROUGHPUT

SECURE CONNECTIONS
